

Assignment 2 Case Study

Stage 2 Tutorial From Problems to Requirements

Week 5 | 60 minutes

Learning goals

- Analyse stakeholders.
- Distinguish functional and non-functional requirements.
- Recognise ambiguity and unsupported requirements.
- Define scope.
- Develop user stories and acceptance criteria.
- Critique AI-generated requirements.

Activity 1 - Stakeholder Map

Stakeholder	Need	Potential conflict
Patient	Easy, reliable way to book, cancel an appointment	Want flexibility but privacy can limit convenience
Practitioners	Quick access to patient history, daily schedule	May conflict with management
Management	Reliable, maintainable system that reduces duplicate bookings and administrative errors	It might increase the cost
IT support	An easy to update, simple rules system	Wants simplicity which might conflict with broader activities.

Activity 2 - Functional or Non-Functional?

- ☐ Functional The system shall allow staff to cancel an appointment.
- ☐ Non-functional The system should remain responsive for the course-scale dataset.
- ☐ Functional The system shall retain cancelled appointments.
- ☐ Non-functional Core business logic should be independently testable.
- ☐ Functional The system shall search for a patient by ID.

Activity 3 - Repair Ambiguous Requirements

The system should be easy to use.

Problem: Easy is not defined under any standard Clarification question: What does easy mean in practice?

Patient search should be fast.

Problem: What counts as fast is unclear Clarification question: what is the maximum acceptable function time?

The system should securely manage data.

Problem: Does not mention what security means Clarification question: What security measures are required?

Appointments should normally be easy to cancel.

Problem: Normally and easy is conflicted to problem 1 and it is not defined Clarification question: What does easy or normally mean in terms steps or time required to cancel?

Activity 4 - AI Requirements Audit

Classify each suggestion: Confirmed / Assumption requiring validation / Unsupported / Out of scope.

AI suggestion	Classification	Evidence / reason
Patients receive SMS reminders.	Assumption requiring validation	As it is not in scope, its needs client sign off before as a firm requirement
Facial recognition login.	Unsupported	This is not referred to anything stated
Receptionists create appointments.	Confirmed	Directly supported by functional requirements and user stories
Online payment.	Out of scope	Not referred to anything in the FR
Practitioners view schedules.	Confirmed	Supported by FR and US
AI recommends treatments.	Unsupported	Not referred to anything in the system
Cancelled appointments remain in history.	Assumption requiring validation	Nothing as stated in the FR or NFR but can be arranged based on confirmation

Exit question

Why is 'AI suggested it' not sufficient evidence for a requirement?

- AI suggested IT is not sufficient evidence for a requirement because is just a reference based on a plausible happening but not a fact about a patient, client, practitioner's actual need. AI can invent needs that might not be expressed by any of the stakeholders. Again it has no authority to define a scope. It cannot make any suggestions saying there is a better scope or no scope for any issue. Also, AI does not have the ability to trace any evidence, which is the prime factor of a requirement. So AI is not sufficient evidence for a requirement.
